Ivanti File Director OneDrive Connector

Unlock 1TB per User of OneDrive for Business Storage

One of Office 365's significant customer benefits is the 1TB of free OneDrive for Business cloud storage provided to every user. While there are many IT advantages for using OneDrive for Business storage, including anytime, anywhere file access; no need to manage bandwidth or force users to use a VPN; reduced storage costs; and reduced infrastructure management, there are also many challenges.

Challenges with Office365's OneDrive Cloud Storage

Because OneDrive storage is provided to users – not IT – administrators lack the controls needed to view and manage its content. Accessing and using OneDrive typically requires changes to user working behaviors. This may necessitate user re-training and force increases in helpdesk calls. Additionally, users employing multiple endpoints to do their work may find that they can't access OneDrive from one or more of their devices.

Ivanti OneDrive Connector – Capture, Control, and Audit OneDrive

The Ivanti[®] File Director OneDrive Connector solution allows IT to capture, control, and audit Office 365 users' 1TB of OneDrive storage. The Connector uses File Director's granular sync engine and In-Location Sync capabilities to migrate user files smoothly to OneDrive cloud storage. However, as with on-premises storage, users' everyday Windows experience when accessing files and folders is unaffected.

With File Director acting as an on-premises broker to OneDrive, IT has complete audit and visibility of how OneDrive storage is being used, while delivering a familiar user experience that feels just like using any other file server. No special folders, no clunky redirection, no endpoint device limitations.

File Director's capabilities don't end with the OneDrive Connector. Acting as a broker between the user workspace and cloud or on-premises storage, File Director makes data migration fast, secure, and invisible to the user. For Windows 10 migration projects, File Director ensures that users' files and folders from their old Windows workspace are available immediately in their new Windows 10 workspace by syncing data either in real time, in the background, or on-demand, so users gain a new Windows 10 workspace that looks familiar instantly.

Key Benefits

- Sync saved files in the user profile, even .PST files, to free OneDrive storage
- Users continue to save to and access files from existing profile locations, eliminating user training
- One solution to access on-premises and cloud storage
- Control which files get synced and to where
- Complete audit and visibility to file access and sync activity
- Advanced clients for all endpoint platforms
- Control network utilization
